1.0   Introduction

The purpose of this memorandum is to document the collection and compilation of data and information that will provide vital insights into the travel patterns, land use, environmental constraints, residents, workers and employers within the study area as well as visitors traveling to and through the Southwest Georgia study area. Readily available data and information from a wide variety of sources including Regional Development Centers (RDCs); state agencies such as Georgia Department of Community Affairs, Georgia Department of Transportation and Georgia Department of Labor, the three Metropolitan Planning Organizations (MPOs) within the study area and federal agencies such as Federal Emergency Management Agency.   Many of these data sets were provided by GDOT offices or gathered from the available data published on public domains by various federal, state, and local agencies. Some of the data is in existing ArcGIS shapefiles while some of the other data sets are in a database or tabular format.   Transportation planning and corridor studies conducted within the study area were also collected.   In addition, vehicle classification counts were collected to supplement the existing vehicle classification counts.

This data is an essential component for developing plans for Southwest Georgia interstate study and for creating the travel demand model associated with this study. Many of these data sets have been collected in a manner that is readily useful in planning applications. In order for these data sets to be used in this study, they have to be refined, validated, and presented in application-ready format. Thus, some of these data sets were either converted into GIS format or formatted in a way that can be used by planning applications. For this study, the majority of the data is required in a shapefile format, which can be recognized and utilized by the ArcGIS software. The resultant networks were checked by GDOT Planning and District Offices; for additional information see Technical Memorandum #5 – Travel Demand Model Development.

Section 1 describes the characteristics of the key data sets assembled for this effort. The data collection are categorized into three different components; current GDOT Roadway Characteristic (RC) and bridge inventory files, FHWA's Freight Analysis Frame work database, and the census related files.

1.1 2007 GDOT RC Road Characteristic (RC) Database

The current GDOT RC file provided for the Southwest Georgia Interstate Study is the latest 2007 version. The GDOT RC database contains two data components; one reflects the backbone of the roadway centerline features in a measured route shapefile, and the other contains detailed roadway

characteristics information in a table stored in a Microsoft Access database. The information stored in these two different file formats needed to be geographically linked together in order to visually display the roadway characteristics information contained in the MS Access databases. This information was used to assist with the building of the highway network used in the travel demand model application.

1.1.1   Measured Shapefile

The measured shapefile, displayed in Figure 1.1.2.1 is a GIS route file which contains route alignment, and route measurement in miles for each route. Each route in the shapefile is identified by a GDOT RC link ID. Each RC link ID signifies the route type, the county in which the route belongs, the designated state route number, and a suffix for the addition roadway functional information. Therefore, the RC link ID is a 10-digit serial number containing the numerical values representing above mentioned elements. A typical 10-ditgit RC link ID is shown below.

- County FIPS (3-ditgit)
- Route type (1-digit)
- State designated route number (4-digit)
- Route suffix (2-digit)

In the RC measured shapefile, the RC link ID is stored in "INV_ROUTE_" field in the attribute table column. In the table shown below, the measured shapefile is identified by the "Shape*" field in the file attribute column denoted with "Polyline M".

Table 1.1.1.1.
RC File Attribute Table Contents

FID	Shape *	OBJECTID	INV_ROUTE_	ROUTE_CLAS	RECAL	LIFECYCLES	ROUTE_NAI
0	Polyline M	503	0872001000	2	0	Active	CR 10
1	Polyline M	504	0872001100	2	0	Active	CR 11
2	Polyline M	505	0872001200	2	0	Active	CR 12
3	Polyline M	270	0873050601	2	0	Active	
4	Polyline M	272	0873050801	2	0	Active	
5	Polyline M	273	0873050901	2	0	Active	
6	Polyline M	274	0873051001	2	0	Active	

This route shapefile includes all GDOT functionally classified roadways inside the State of Georgia. It is a combination of roadway infrastructure of the 159 Georgia counties, each of them having a complete set of the routes system inside it. This means that the inter-county routes change county code in the RC Link ID whenever they cross the county line. With such route and roadway alignment information for each functional classified roadway inside Georgia, the measured shapefile

provides a clear reference for the tabular data stored in the MS Access database to be populated along the designated route.
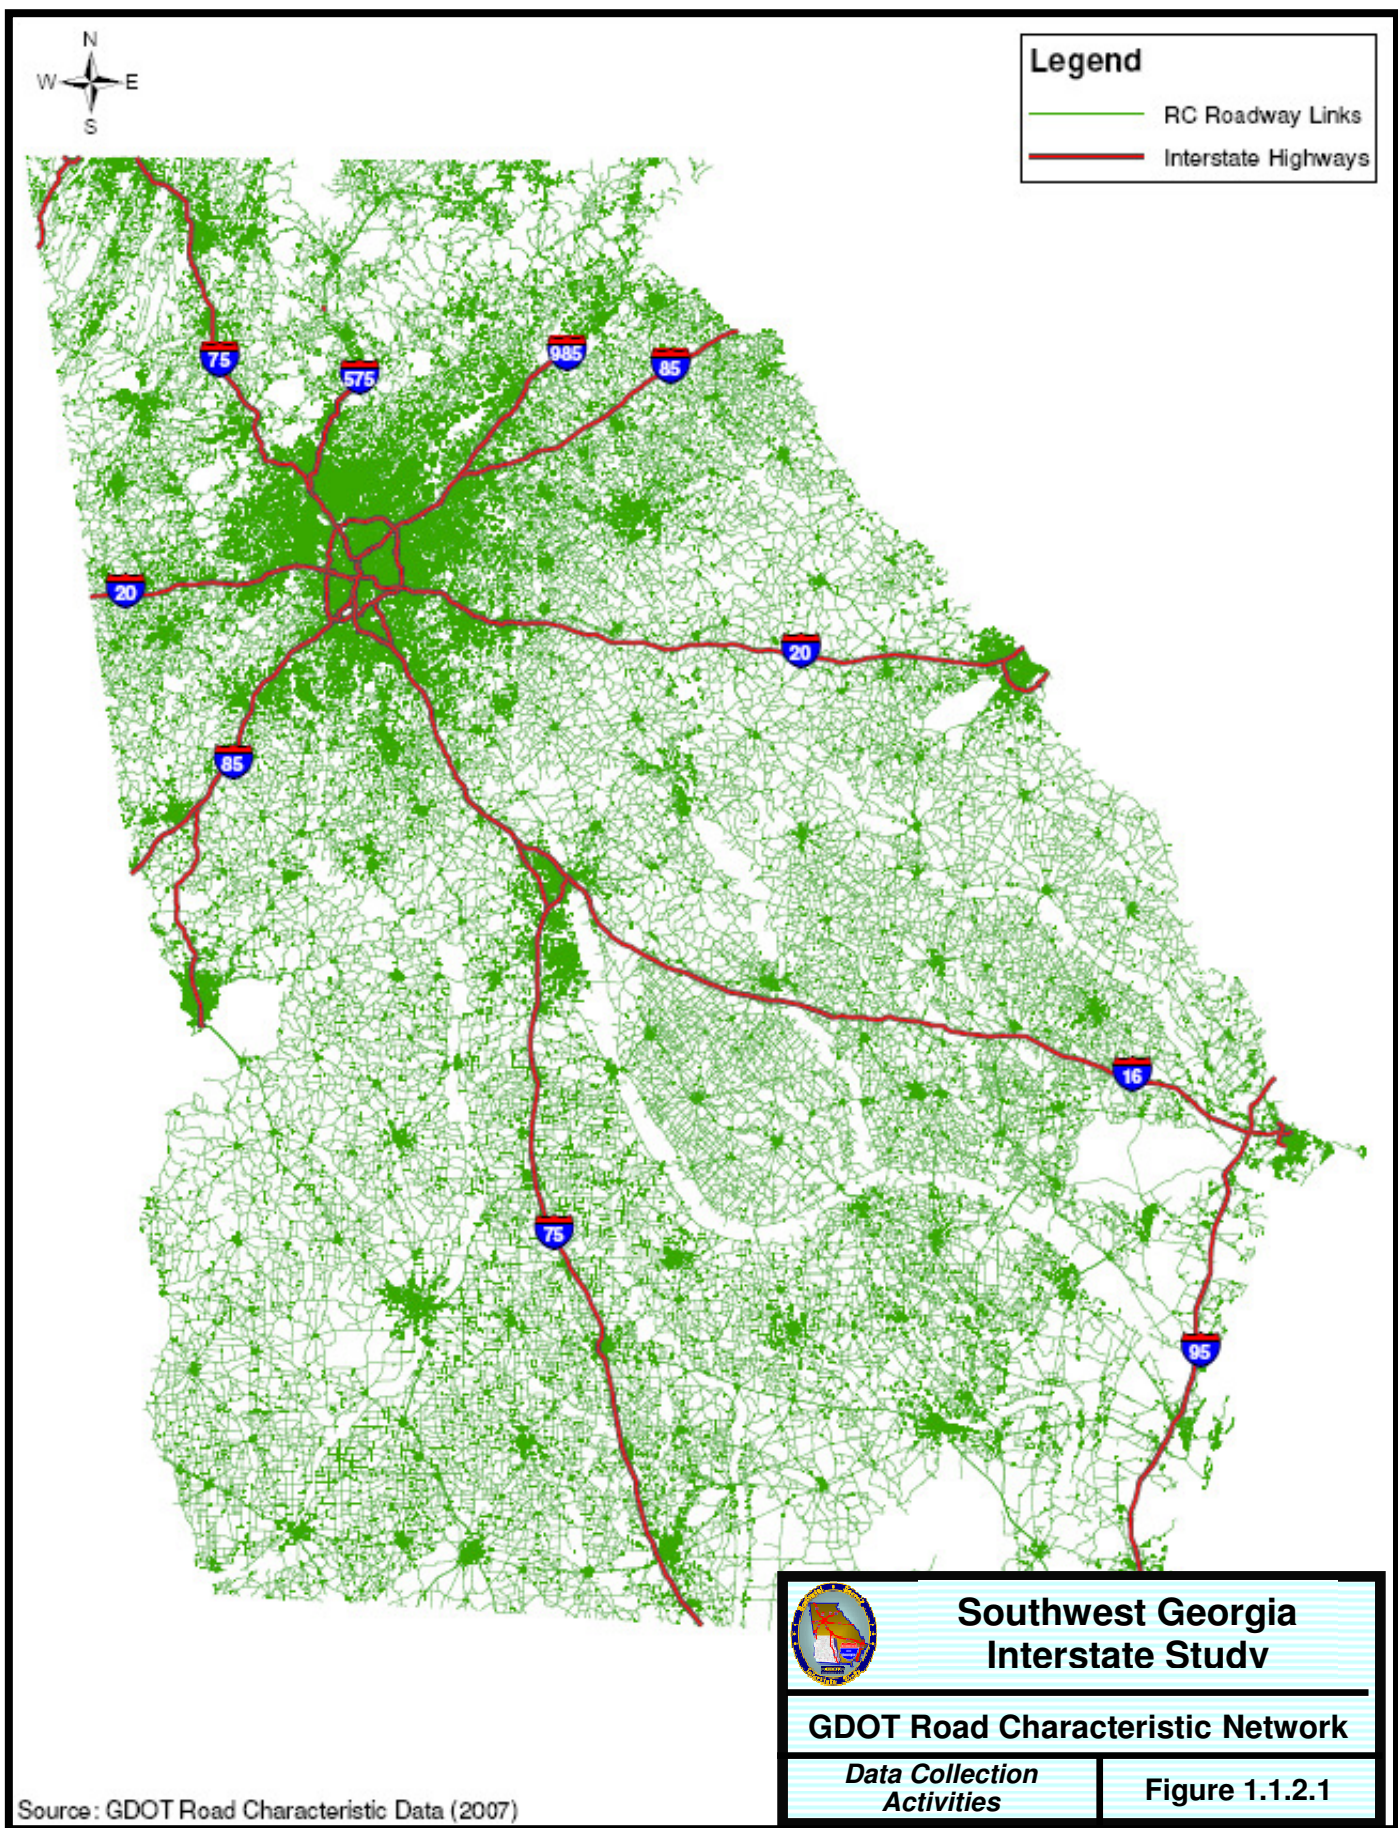

1.1.2   MS Access Database

While the measured shapefile provides a roadway skeleton, the MS Access database furnishes the necessary information to populate the skeleton. The database contains rich information regarding the roadway existing condition and characteristics ranging from the number of traveled lanes to the type and width of the roadway shoulder. All of this information is maintained and updated very year by GDOT field staff. The information regarding a particular roadway is separated into a series of segments along a route. Each segment represents a delineated part of the roadway usually less than a quarter of a mile. This delineation of the roadway segment is reflected by the route mile posts stored in the "BEG_MESUR" and "END_MEASUR" attribute columns in the database. As shown in the attribute table below, it is the three attributes of "BEG_MESUR", "END_MEASUR", and the "RCLINK" that provide a channel of communication between the measured shapefile and the RC MS Access database. This communication link established between the measured shapefile and database enables the roadway characteristics information stored inside the MS Access table to be recreated and displayed inside a GIS environment.

Table 1.1.2.1
RC File Attribute Table Contents

Before the implementation of the linkage between the database and the shapefile, some cleaning work was performed on the database attribute field names. The existing field names usually contain more

than 10 characters, which would be truncated after they have been converted into the DBF format table in a shapefile, a limitation currently presented by the DBF file. In order to retain meaningful headers for each field name in the shapefile table, an abbreviation for each of the original field names had to be created before converting them into the DBF table. This translation between the original field names and the abbreviated names is presented in Table 1.1.2.2.

1.1.2 Application of GDOT RC File inside GIS Environment

The creation of the final GDOT RC shapefile, in which each route is attached with the complete roadway characteristics information, is accomplished inside the ArcGIS software. The software provides a platform for establishing the linkage between the MS Access table and the measured shapefile, as well as a tool for performing analysis and displaying the data. The finished RC shapefile is primarily used to assist with the Southwest Georgia Interstate travel demand model network development and crash data analysis. The physical RC links and their attributes are compared against the model network to fill in the gaps and reduce inaccuracies in the model network. The database provides functional class designation and number of lanes for each roadway which is essential to validate the model network and assign the appropriate capacity to roadway segments based on these characteristics. Some of the RC information, such as the current number of lanes was verified by GDOT district offices before it was used to build the model network.

After the RC shapefile has been created, it can be used to display the roadway system by the number of lanes and functional class, and assist with the examination of various roadway deficiencies as determined by the current GDOT standard. The shapefile can also be overlaid with the accident data in assisting the crash experience analysis. Various roadway characteristics which might contribute to unusually high level of crash occurrence could be placed under close examination.

1.1.3 Bridge Inventory Database

The National Bridge Inventory (NBI), which is maintained and updated every year by each State DOT and published by the FHWA, was collected. The NBI database for Georgia is a collection of data information covering over 160,000 of the Georgia bridge structures and culverts located on public roads, including Interstate Highways, U.S. highways, State and county roads, as well as publicly-accessible bridges on Federal lands. It presents a summary analysis of the number, location, and general condition of highway bridges within the State. Each bridge retains information ranging from bridge structure type to bridge structure sufficiency rating. The bridge structure sufficient rating the one of the most important attributes which determines the bridge structure adequacy and safety.

Each bridge was located using GIS by its longitude and latitude information stored in the database. A point shapefile thus was created including all the bridges' attribute information along each bridge's geographic location. The shapefile was projected in a system that is consistent with the projection used by the rest of the GIS files for the Southwest Georgia Interstate Study, so that overlay analysis with other GIS layers could be possible. To avoid long field headings in the shapefile attribute table, an abbreviation was created for each of NBI field description. The following table shows the

abbreviation of each field name in the shapefile and its associated field description in the original bridge file.

1.1.4   FAF2 Freight Analysis Framework

The primary data used for developing truck trip tables for the Southwest Georgia Interstate travel demand model is the FHWA's FAF^2 databases; 2006 FAF^2 provisional data was used to build the base year trip tables and forecasted FAF^2 data to build 2040 trip tables. The FAF^2 database was developed by the FHWA in cooperation with other U.S. Department of Transportation (DOT) modal administrations having freight responsibilities. The database was derived primarily from data collected every five years as part of the Economic Census and other public, private or proprietary databases.   In responding to significant commodity flow changes that occur during the period between each Economic Census, the FHWA also produces provisional estimates of commodity flow by origin, destination, and mode for the most recent calendar year. According to FHWA, these provisional data sets are extracted and processed from yearly, quarterly, and monthly publicly available publications for the current year or past years and are less complete and detailed than data used for the 2002 base estimate. The 2002 estimate is based primarily on the Commodity Flow Survey and other components of the Economic Census. The FAF^2 provides estimates for 2002 and the most recent year plus forecasts through 2035.

The FAF^2 Commodity Origin-Destination Database estimates annual tonnage and value of goods shipped by type of commodity and mode of transportation among and within 114 areas, 17 international gateways, as well as 7 international trading regions. The data is broken down by modes of transportation and types of commodities, as well as classified into domestic flows, North America flows, and international flows. The FAF^2 freight analysis zones and the example of the data content are shown in Figure 1.1.4.1 and Tables 1.1.4.1 – 1.1.4.6.

The FAF² database categorizes the transportation modes into the following 7 different types.

- Truck
- Rail
- Water

- Air
- Truck-Rail Intermodal
- Parcels (U.S. Postal service or Courier), Truck-Water, and Water-rail
- Pipelines and Other Modes

The truck mode includes both private and for-hire trucks. Private trucks are trucks operated by a temporary or permanent employee of the owner of the shipment. For-hire trucks refer to trucks that carry freight for a fee collected from the shipper, recipient of the shipment, or an arranger of the transportation. The commodity flows associated with trucks will be the basis for the development of the truck trip table.

The types of commodities provided by the FAF[2] are classified into the two-digit 43 Standard Classifications of Transported Goods (SCTG). The SCTG consists of a blend of transportation characteristics, commodity similarities, and industry-of-origin considerations, designed to create statistically significant categories.

Table 1.1.4.6
SCTG Commodity Group

SCTG Code	Commodity Class
1	Live animals and live fish
2	Cereal grains
3	Other agricultural products
4	Animal feed and products of animal origin, not elsewhere classified (n.e.c.)

1.1.5 Census and other GIS Data Collections

Various other GIS data sets were also collected for the Southwest Georgia Interstate Study. These GIS files were used in developing the travel demand model network, creating a nationwide TAZ system for the model, geographically locating SE data, allocating business addresses, identifying traffic count locations, and so forth. A list of data items collected in this effort is shown below.

- US Census & Tiger Line Data
- Georgia Grid
- National Highway Planning Network (NHPN)
- Adjacent State Regional Planning Area
- Daily Traffic Counts
- Existing Vehicle Classification Counts

These data sets were collected in formats of GIS shapefile, database tables, or other data types. But all non-shapefile formats were post-proceeded or converted into a shapefile to facilitate the GIS analysis with other data sets. Many of the data sets were collected with unidentified coordinate systems. Projection system for each of GIS data set was correctly identified and assigned in order to be consistent with rest of other shapefiles. The projection system used for the Southwest Interstate Study is "NAD_1983_Georgia_Statewide_Lambert" with linear unit of US foot. This system is used across all GIS related analysis for the project.

1.1.5.1 US Census & Tiger Data

The census tract polygon shapefile for Georgia was collected from the ESRI 2000 Census Tiger/Line data, together with the 2000 census SF1 file, which contains the tabular census information associated with each census tract. Other GIS files that were collected from the ESRI source include the following.

- County Polygons
- Tiger Street lines
- Rail lines
- Urban Areas
- Water Polygons
- Wetlands

This collection of data was primarily used to develop the base year TAZ system and to allocate its associated SE data. All these data sets provide necessary geographic reference and identification of natural barriers that exist within the study areas, thereby offering a guideline in determining the appropriate boundary for each TAZ inside the study area which needs a detailed representation.

The entire TAZ system of the Southwest Georgia Interstate model extends over all the 48 continental states, including the District of Columbia. While the state boundaries are used to define the TAZs further away from the Southwest Georgia area, the regions surrounding the study area have finer TAZ boundaries. The majority of the data collection efforts were orientated towards the coverage of the State of Georgia, and specifically the study area with the Southwest region. To appropriately establish TAZ boundaries for the surrounding areas, similar data for the areas is also needed to complete the TAZ system. For this reason, the same data sets for adjacent States of Alabama, Tennessee, North Carolina, South Carolina, and Florida were collected as well.

The Tiger street line file not only offers a reference for the existing roadway alignment but also provides an exceptional utility. The street line file can be used for address matching that can be used to automatically pin-point the locations for businesses and residences. The attributes of the street line file contain detailed information regarding street name, from-mile and to-mile posts of each roadway segment, as well as Zip code along each roadway, a minimum requirement for address geo-coding by GIS. Therefore, the Tiger street line file was also used to develop an address locator inside ArcGIS, which was later used to allocate the detailed business locations inside the southwest Georgia region.

1.1.5.2 Georgia Grid Polygon

Two sets of Georgia Grid polygon files, each for 7.5x7.5 mile and 3.75x3.75 mile grid, were collected from the Georgia GIS Clearing House. These grid polygons were reserved to store the SE information for the regions occupied by a specific grid. This will facilitate the process to reallocate the SE data whenever the need may arise to change the geographic boundary of the TAZ system. The grid system covers the entire area of the state of Georgia. There are a total of 1,020 and 4,067 girds respectively in each of the grid coverages. Each of the grids is identified by a grid name and a grid index code.

1.1.6 National Planning Highway Network (NHPN)

The National Planning Highway Network (NHPN) contains line features representing over 450,000 miles of current and planned highways in the U.S. The NHPN, shown in Figure 1.1.6.1, consists of interstates, principal arterials, and rural minor arterials. The NHPN is in a GIS polyline

shapefile format and is the digital source used for coding and publishing the FHWA approved National Highway System maps. The link connectivity in this network is considered good. This network served as the fundamental network on which the Southwest Interstate travel demand model was based. Link attributes of the network include roadway number of lanes, Highway Performance Monitoring System (HPMS) roadway functional classification, and others. The number of lanes and the functional classification of the links were also compared and validated against the GDOT RC data for the roadways links located inside the State of Georgia. Since the NHPN is updated frequently to response to the changes on the nation highway system, the latest version (2005) was used in the Southwest Georgia Interstate Study. In addition, only the networks for the continental 48 states were included for the development of the travel demand model.

1.1.7 Adjacent State Regional Planning Areas

The purpose of collecting adjacent state regional planning area data is to facilitate the development of the TAZ system for the regions immediately surrounding the State of Georgia and the Southwest Georgia Interstate study area. The primary goal of using this data is to obtain an accurate boundary reference for each of the Regional Planning areas, thereby assisting in the appropriate aggregation of the SE data for those regions. Each Regional Planning Area includes several counties, according to the jurisdiction of its Regional Planning Counsel (RPC). These counties and their associated SE data were collected and then aggregated into bigger planning regions. Accordingly, a polygon shapefile was then created at this aggregated geographical level with each polygon representing a Regional Planning Area. A typical example of the State Regional Planning Area is shown in Figure 1.1.7.1. Figure 1.1.7.1 displays the sample attribute table for the shapefile. These Regional Planning Areas were later incorporated as parts of the entire TAZ system; each of them represents an individual TAZ member.

1.1.8 Traffic Count Stations

The GDOT coverage traffic count station shapefile was also collected from the Georgia GIS Clearing House. A total of over 17,000 GDOT coverage count stations are included in the shapefile. Each station includes the Annual Average Daily Traffic (AADT) data from year 2001 to 2006, as well as its reference geographic location. The count numbers are annotated either with "Actual" or with "Estimate" to signify the method used to generate the data. Also, many of these coverage stations have estimates for truck mixture. Overlay of the coverage count data with the model network layers in GIS helps the process of transferring traffic count information from the count stations to the network links in the travel demand model. This method is also used to calculate the accident rates. The coverage of the traffic count stations shapefile is shown in Figure 1.1.8.1.

1.2   Collection of Supplemental Data

As part of this study effort additional data was collected. Vehicle classification counts were collected throughout the study area to supplement the existing vehicle classification counts. These counts will be used to assist with the evaluation of freight and goods movement within the study area.

1.2.1 Vehicle Classification Counts

There are approximately 1,500 locations where GDOT regularly collects average daily traffic and 65 locations where the percent of truck traffic is collected within the study area. These locations are shown in Figure 1.2.1.1. To supplement these data sets, daily vehicle classification counts were collected at 25 locations, shown in Figure 1.2.1.2.   The selection of the sites for the collection of the vehicle classification counts was based on the following considerations.

- Location of existing traffic count locations
- Location of existing traffic count locations with percent truck volumes
- Traffic volumes
- Number of lanes per facility
- Functional classification

Summaries of the vehicle classification counts by vehicle type and type of data for each of the locations are shown in Figures 1.2.1.3- 1.2.1.27 and Tables 1.2.1.5. – 1.2.1.30.   The results from the counts were reviewed and compared to existing surrounding counts for reasonableness. The percentage of travel due to trucks was estimated based on the counts by the vehicle classification categories. These percentages were then incorporated into the highway network to assist with the validation of the highway assignment.

The peak hour traffic volumes for automobiles occurred between 7:00 a.m and 8:00 a.m. in the morning and 5:00 p.m. and 6:00 p.m. in the evening for practically all of the locations. The peak hour travel movements for both single unit and heavy duty trucks varied dramatically by hour for most locations. The peak hour traffic movements for single unit and heavy trucks occurred between 9:00 a.m. and 12:00 p.m. and between 12:00 p.m. and 4:00 p.m depending on the location. For the locations surveyed, the peak hour truck movements usually did not coincide with the peak hour automobile travel.   In all of the sites, the largest single unit and heavy duty truck movements occurred between 10:00 a.m. and 6:00 p.m.

The percent of single unit truck traffic accounted for a range of 3.6 to 18.9% of the daily traffic. In only the five locations listed below, did the percent of single unit truck traffic exceed 10% of the daily traffic.

Table 1.2.1.2
Locations with Largest Percent of Daily
Single Unit Truck Traffic

Location	Name	County	Total Daily Traffic	Daily Single Unit Truck Traffic	Percent Daily Single Unit Truck Traffic
4	US 27/Martha Berry Hwy	Decatur	5,079	718	14.1
9	US19/Georgia Florida Pkwy	Mitchell	8,050	1,335	16.6
14	US 19	Schley	1,772	335	18.9
18	US280/SR30	Sumter	3,572	474	13.3
24	SR133/Billy Langdale Pkwy	Worth	2,995	421	14.1

While these percentages may be high, the actual number of single unit truck trips ranged from 335 to 1,335. Location 9 – US19/Georgia Florida Pkwy in Mitchell County had the largest number of daily single unit truck trips, 1,335, while Location 4 - US 27/Martha Berry Hwy in Decatur County had the next highest number of daily single unit truck trips of 718.

In 18 of the 25 locations surveyed, the percent of daily heavy truck traffic exceeded the percent of daily single unit truck traffic. The percent of daily heavy truck traffic varied dramatically between the stations from 1.7% to 38.1% representing 26 to 1,521 heavy truck vehicles. The following locations identified in Table 1.2.1.3 had the highest percentages of daily heavy truck travel. The total daily traffic volumes at these locations are below 5,000.

Table 1.2.1.3
Locations with Largest Percent of Daily
Heavy Truck Traffic

Location	Name	County	Total Daily Traffic	Daily Heavy Duty Truck Traffic	Percent Daily Heavy Duty Truck Traffic
2	SR37	Clay	909	196	21.6
11	US82/Jefferson Davis Memorial Hwy	Quitman	1,846	497	26.9
12	US27/SR1/Martha Berry Hwy	Randolph	1,274	333	26.1

Location	Name	County	Total Daily Traffic	Daily Heavy Duty Truck Traffic	Percent Daily Heavy Duty Truck Traffic
13	US27/SR1	Randolph	1,372	523	38.1

Southwest Georgia Interstate Study

1.3 Collection Corridor Studies and Transportation Studies

As part of this study, other reports and studies performed for various corridors or projects were collected. The purpose of this effort is to collect background information on past projects that have been evaluated in the study area. These reports will provide information on the needs for the various projects. This information will be used to assist with the identification and evaluation of current and future transportation improvements in the study area.

1.3.1 Summaries of Reviews of Studies
The following studies were collected and reviewed. The key recommendations of the studies are listed below.

1. **SR-38, Thomas County, Old Albany Road (March, 1999)**
   - Recommend sidewalk along one side of SR-38 BU
   - Evaluate intersections of SR-38 BU with SR-38 and SR-3 for possible improvements
   - Investigate accidents near North Pinetree Boulevard
   - Not recommend widening of SR-38 BU

2. **Revised I-75 at SR 215 Needs Analysis (March, 2002)**
   - The Office of Planning recommends a project be programmed to reconstruct/reconfigure the I-75 and SR 215 interchange
   - Recommends that the exit/entrance ramps be relocated to allow proper spacing for truck turning movements, the bridge needs to be widened and include a left turn lane from SR 215 to I-75 northbound and southbound. The entrance and exit ramps need to be lengthened to prevent traffic from blocking access to the interstate. Also, a right turn lane from I-75 northbound to SR 215 including a decel lane into the businesses and industrial park should be constructed.

3. **State Route 133 Corridor Study (September, 1999)**
   - Recommends a short-range project to widen SR-133 to four lanes beginning in Albany at the four-lane section of SR-133 and extending approximately 4.9 miles south of CR-134 (Gibson Road)
   - Recommends a widening project be developed for the section of roadway south of Gibson Road extending approximately 24 miles to the multi-lane section in

Moultrie. The widening can be subdivided into three smaller projects with the section between the proposed short-range project and SR-112.

- NOTE: *The section of SR-133 in Dougherty County has to be evaluated by the MPO, Albany- Dougherty County Planning Commission*
- Three (3) long-range projects are recommended for the section of SR-133 between Moultrie and Valdosta. (1) The four-lane section west of Valdosta will need to be extended beginning at the west project limits of the existing construction project and ending near Brooks County Road 10.
- (2) The remaining section of SR-133 between Morven and Brooks County Road 10 (5.5 miles) will need to be widened
- The third (3) recommended project is approximately 6.2 miles and would extend the four-lane section south of Moultrie to Berlin

4. SR 91 CORRIDOR STUDY: Seminole, Miller, Baker and Dougherty Counties (February, 2005)

- In summary, the study determined no need to (Not recommend) widen SR 91 in Seminole, Early, Baker and Dougherty County. Current and future traffic volumes, Level of Service, accident statistics, and land use development do not support widening from two to four lanes.

5. SR 122 Truck Route (November, 2000)

- Office of Planning proposes two (2) minor projects to address the difficulties trucks are having negotiating turns at SR-97 and at Oakland Street, as well as one long-range project to address a projected capacity deficiency along SR-112.
- (1) A short-range project to add a 6-foot paved shoulder along the northbound shoulder of SR-112 at the intersection with SR-97 is proposed.
- (2) A second short-range project will accommodate the northbound right turn movements at the intersection of Scott Street and Oakland Street.
- Recommends widening SR-112 and SR-37 to four-lanes. SR-37 is recommended for widening starting east of the middle and elementary schools at the existing four-lane section to just east of SR-3. A majority of the widening can be done within the existing right-of-way with most of the work accomplished by restriping the existing roadway. Widening in the downtown area will require eliminating on-street parking on one side of the street. Currently off-street parking is provided on both sides of SR-37.

- SR-112 is recommended for widening from SR-97 to SR-3, and it is recommended that the radius on SR-97 approaching the SR-97/SR-112 intersection south of town be improved.
- Planning recommends that Traffic Operations look at the timing and phasing on SR-37 and SR-112 to see if changing the signals from preset to actuated and coordinating signals will improve travel along these routes as well as look at the left-turn lane capacity of the eastbound approach of SR-3/SR-112.

6. **Moultrie-Colquitt County Multimodal Transportation Study (June, 2001)**
   - Short Term – improvements to SR 37 approaching downtown Moultrie from the west, improvements to SR 33/US 319 Business from downtown Moultrie to Lower Meigs Road, New east-west roadway connection between Spence Field and Colquitt Regional Medical Center, and various sidewalk network improvements throughout Moultrie.
   - Medium Term – Improvements to SR 37 on the east side of downtown Moultrie, SR 33/ US 319 Business improvements south of Lower Meigs Road, Sidewalk connections to the bike/pedestrian trail extension.
   - Long Term – Widening of SR 133 through Colquitt County.

7. **Vienna Bypass Final Report (2000)**
   - Bypass recommended for reexamination in a few years…. (Not recommend at this time)
   - Intersections that need traffic operation improvements: State Route 27 and State Road 215, State Route 7/US 41 and County Road 297, and State Road 27 and County Road 324
   - Recommended rail crossing improvements: County Road 297 - Construct an at-grade crossing at this intersection, County Road 75 and County Road 326 - Close these at-grade crossings due to intersection geometry.

8. **Colquitt Bypass Study (October, 2001)**
   - The Office of Planning recommends the construction of a local truck bypass along CR-32 as the best alternative for alleviating traffic concerns within the City of Colquitt. This bypass provides the greatest benefits to the city, while minimizing negative impacts. The route will allow through truck traffic traveling between SR-45 and SR-91 to avoid Colquitt Square, thus reducing safety risks and congestion inside the City of Colquitt.

Southwest Georgia Interstate Study

9. US 41 Corridor Study (April, 2005)

- In conclusion, the study recommends the pursuit of alternatives #4, #5, and #6.
- #4 Install left turn lanes on U.S. 41 (north and southbound) at SR-37; eliminate on-street parking on the east side of U.S. 41 (traveling northbound) south of SR-37 and eliminate parking spaces on the west side of U.S. 41 (traveling southbound) north of SR-37; and install a new traffic signal (actuated timing) at the SR-37/U.S. 41 intersection along with new signage.
- #5 Make improvements at the intersection of Old Coffee Rd./CR-240 along U.S. 41; upgrade Old Coffee Rd. to state standards between I-75 and U.S. 41 in order to accommodate truck traffic as well as to divert the traffic (in general) away from downtown Adel.
- #6 Make intersection improvements (installing left turn lanes and fixing the intersection's skew) at Old Quitman Rd. /CR-216 to assist with diverting traffic (trucks especially) away from downtown Adel.

10. SR 62 Corridor Study (August, 2006)

- The study determined no need to widen SR 62 in Early, Calhoun and Dougherty County (Not recommend)
- In the future, it is recommended that SR 62 be monitored for potential safety and operational improvements (in the areas indicated by Table 1.2) that showed an above average accident rate.

11. Transportation Needs Analysis for the Tifton Georgia Area (February, 2000)

- Short-Range Projects (2000-2002)
  1. Signalize intersection of Kent St. and New River Rd.
  2. Add turn lanes and signal at intersection of New River Rd. and Ferry Lake Rd.
  3. Add left turn lanes on US31 9 at New River Rd.
  4. Restripe US41 as 3 lanes from Southern Ave. to Beech St.
  5. Signalize intersection of Ferry Lake Rd. and Goff St.
  6. Signalize 1 restripe intersection of Goff St. and US82
  7. Channelize right turn from WB US82 to NB Magnolia Ave.
  8. Add left turn lane and phase on WB 8th St. at Virginia Ave.
  9. Signalize intersection of Thunderbird St. and 2nd St.
  10. Convert intersection of 17'" St. and Park Ave. to four-way stop
- Mid-Range Projects (2003-2009)
  11. Connect Tifton-Eldorado Rd. to Southwell Blvd.

Southwest Georgia Interstate Study

12. Widen US41 from SR125 to Southern Ave.

13. Construct bypass from US31 9 North to US41 South

14. Signalize intersection of SR125 South and US41 South

- Long-Range Projects (2010-2019)

15. Connect Kent St. to 20th St.

16. Construct bypass from US41 South to US82 West

12. Cuthbert Bypass Study (June, 1998)

- Recommends construction of a bypass, primarily to accommodate trucks, by 2010 from SR 50/US 82 to SR 1 BUS/US 27 BUS on new alignment south of downtown; and monitoring of traffic to determine whether implementation should be accelerated.

13. Madison to Valdosta Corridor Study (May, 1997)

- Not recommend widening but monitor conditions for unanticipated growth which might require reexamining options

- Recommend a right hand turn bay with an island at Duvall and Livingstone Streets (for safety and to facilitate truck movements)

- Redesignate the truck route continuing on SR-53 to Interstate 10, instead of through the industrial park to SR14.

14. SR31 Passing Lane Study, Valdosta to Lakeland (June, 2003)

- Widen SR 31 from North Forrest Street/Lowndes County Road 138 in Valdosta to just past Stallings Road/Lowndes County Road 83

- Recommends the construction of northbound and southbound passing lanes for SR 31. One mile passing lanes should be added within TC Station 121 and 123.

- In Lakeland, a short-range project is recommended to address operational problems in the downtown area. The recommendation requires state highway system changes and restrictions on left-turn movements in downtown. Left-turn movements at the existing intersection of SR 135 with SR 11 should be restricted during P.M. and A.M. peak hours. State Route 135 Bypass should be redesignated as SR 135 and sections of SR 135 that are not currently running common with another state route should be removed from the state highway system beginning at SR 135 BY south of town and ending at SR 135 BY north of town. Efforts should also be made to remove SR 135 Loop from the State Route System with the possibility of adding CR 3001Murray Boulevard to the system. SR 135 Loop is in a rural residential neighborhood serving residential traffic and no through traffic.

15. Cairo Corridors Transportation Study (March, 2003)

- Recommends improvement to the intersection of 17th Ave and SR112/SR38. Concept provides access to the planned development while at the same time realigning SR112 and 17th Avenue to intersect SR38 at ninety degree angles.
- A new bridge is recommended along Joyner Road with an adequate load limit to service fully loaded tractor trailers.
- The Joyner Road approach to SR93 should be reconstructed to accommodate both a left turn lane and a right turn lane.
- The northbound SR93 approach should be constructed to accommodate both a right turn and through travel lane.
- Improve drainage along SR 112 proximate Wight Nursery and Bracken Nursery to control sheet flooding during major rain events
- Note: *no corridors studied recommended for widening*

16. Cordele Truck Loop Study (November 2003)

- Office of Planning does not recommend a truck loop north or south of Cordele in Crisp County but we do recommend that the intersections of SR30/US280with Joe Wright Drive, 6th Street, 5th Street, 4th Street, Owens Street, Pecan Street, Moore Street and Greer Street be studied by the Office of Traffic Operations due to greater than average accident rates.

17. Colquitt County and City of Moultrie Transportation Analysis (March, 1993)

- SR 33 - Resurface from SR 35/US 319 south to the Brooks County Line
- SR 37 - East bound passing lanes - M.P. 8.70 to MP 9.70 and west bound M.P. 9.8 to M.P. 10.8
- SR 37 - Bridge replacement - Little Creek SR 37 - Widen and reconstruct to a 4-lane urban section from near Park Avenue west to 0.2 mile west of the SR 111 intersection including the bridge over the Ochlockonee River
- SR 37 - Extend the east-west one-way pair from east of SE 7th St. to west of 11th St.
- SR 133 - Remove the north-south one-way system
- SR 111 - Resurface from SR 37 north and east to SR133/US 319 business
- SR 133 - Widen to a 5-lane urban section in Moultrie from SR 35/US 319 north to the existing 4-lane section near Lower Meigs Road

- SR 133 - North bound passing lane - M.P. 19.1 to 20.1 and south bound passing lane - M.P. 21.0 to 22.1
- SR 256 - Bridge replacement over Warrior Creek
- SR 256 - Widen and resurface from 22 feet wide to 24 feet wide all of SR 256 in Colquitt County
- SR 270 - Widen - 22 feet to 24 feet from Mitchell County line to Bay Street in Doe Run.

18. Adel Bypass Study (February, 2002)

- Not recommend constructing a bypass at this time
- Recommends traffic operations analysis at Burwell Ave., US 41/SR 7, and Parrish Ave. intersections with SR 37 to address queuing problems.
- Recommend traffic operations analysis at intersection of CR 216 and US 41/SR 7 when new industrial park opens

19. Study of Proposed Improvements to GA Highway 133 (est. 1999 – 2000)

- Note: *this is an economic development study by 2 UGA Profs.*
- The proposed widening of Georgia Highway 133 creates increased opportunities for economic development in the five county study area. Improvements in transportation networks have been shown to aid business relocation and expansion, and to raise the wages of manufacturing employees. Reliable roads also help citizens to expand their horizons in terms of employment, shopping, and recreational opportunities. This project should provide the same sort of economic impetus for the study area. *However, economic development will not happen merely due to the presence of a wider road.*

20. Latin America Trade and Transportation Study (March, 2001)

- *Note: this is a general study discussing the growing importance of Latin American trade and its multi-modal impacts: Port, Airport, Rail, Highway. Georgia is included as part of the "Alliance" region = Southeast + Puerto Rico*

- Says that there will be a need for additional capacity in LATTS corridors to accommodate trucks or there will be deteriorating speeds and provides estimated 2020 $
- Calls out US 19/ 82/ 27 as a Tampa to Memphis route with no deficient miles

- Calls out I-75/US 24 as a South Florida to Illinois route with capacity and paving needs
